Introduction

The I-7188 series controllers are designed for embedded systems that require high reliability, PC-compatibility, compactness at a reasonable price. The controllers can be integrated into an OEM product as a processor core component. By building your product around I-7188 series controller, you reduce the time from design to market introduction, cut development costs, minimize technical risks, and deliver a more reliable product. I-7188 is the first generation product and I-7188XA, I-7188XB and I-7188XC are the second-generation products. The major differences are communication ports, digital I/O port, and user defined I/O pins. Except I-7188, all I-7188XA/XB/XC support I/O expansion bus.

I/O Expansion Bus and Expansion Board

The I-7188XA, I-7188XB and I-7188XC support I/O expansion bus. The I/O expansion bus can be used to implement various I/O functions such as D/I, D/O, A/D, D/A, Timer/Counter, UART, flash memory, battery backup SRAM, AsicKey & other I/O functions. Nearly all kinds of I/O functions can be implemented in this bus. Our I/O expansion boards offer features in addition to those provided by I-7188XA/XB/XC embedded controller. Expansion board can increase controller's I/Os and memory storage capabilities. The integrated modular design of the expansion board allows a fast, easy, and flexible way of upgrading our controller's capability. Each I/O expansion bus supports one expansion board.

Introduction

There are many RS-232 devices in industry applications. Nowadays it becomes important to link all those RS-232 devices together for automation & information. Usually those RS-232 devices are far away from the host-PC & widely distributed in the factory. So it is not a good idea to use multi-serial cards to connect all these RS-232 devices together. Our I-752N series products can be used to link multiple RS-232 devices by single RS-485 network. The RS-485 is famous for its easy maintenance, simple cabling, reliable and low cost. When the user wants to connect RS-232 devices to 10BASE T, our I-7188EN series products can meet this demand.

Can used as Addressable RS-485 to RS-232 Converter

Basically our I-752N products are Master-type converters. The I-752N uses our R.O.C. Patent 086674. Other competitor's converter is Slave-type and can't work stand alone without host-PC. In real industrial application, the demand is different case by case and customers are not satisfied with Slave-type. The I-752N is very powerful and can analyse the local RS-232 device, D/I or D/O without host-PC.

Can be used as an Embedded Controller

Can be used as RS-485 to RS-232 Device Server

The Device Server is an appliance that network enables any device with a serial communication port. Our Intelligent Communication Controllers allow those devices to become connected to the RS-485 network.

i-7188EX Embedded Internet/Ethernet Controller SERIES

I-7188EX/I-7188EXD

Why! Ethernet Solutions

"Embedded Internet" and "Embedded Ethernet" are hot topics today. Nowadays the Ethernet protocol becomes the de-facto standard for local area network. Via Internet, connectivity is occurring everywhere, from home appliances to vending machines to testing equipment to UPS...etc. Many embedded designers now face dilemma of adding Ethernet interface to their products, either for use with local networks or for connecting to the Internet. Solutions to this problem include both hardware and software. Connecting via Ethernet requires a software protocol called TCP/IP. The installed base of Ethernet networks is huge and growing. Most office building, factories, and new homes have installed Ethernet network. With Ethernet, the network is always available. Using Ethernet for network in industrial area is appealing because the required cabling is already installed.

Introduction

The I-7188EX is powered by 80188-40 processor with 512K bytes of static RAM, and 512K bytes of Flash memory. One serial RS-232 port and one RS-485 port are provided. Ethernet support is provided by a NE-2000 compatible controller with 16K bytes of on-chip buffer memory and 10Base-T media interface. The I-7188EX also provides 14 user defined I/O lines. A cost-effective I/O expansion board with A/D, D/A, relays drivers and protected inputs are available. The I-7188EX also supports battery back-up SRAM board and Flash-Rom board, providing non-volatile mass storage from 128K bytes megabytes to 64 megabytes. The 10BASE-T port is equipped with a RJ-45 connector. The 10BASE-T interface supports max. 100-meter Cable length between I-7188EX and the network hub.

Introduction

I/O Expansion Bus and Expansion Boards

I-7188XA, I-7188XB, I-7188XC, and I-7188EX support I/O expansion bus. The I/O expansion bus can be used to implement various I/O functions such as D/I, D/O, A/D, D/A, Timer/Counter, UART, flash memory, battery backup SRAM, AsicKey & other I/O functions. Nearly all kinds of I/O functions can be implemented in this bus. The user can choose our I/O expansion boards or design his I/O expansion boards. If the user chooses small size I/O expansion board, then he can mount directly this I/O expansion board on I-7188 controller. Customized I/O Expansion Boards can be ordered by ODM project.
